

Thanks for Purchasing Our Seed Starting "Peat Pots" & Nutrient Rich Soil Pellets
"An Easy and Effective Way to Start Your Garden From Seed"

Simply add water to the dehydrated soil pellets and they will very quickly expand to 5 times their size. You may choose to place several dry pellets in a tray or pan and add all the water at once, then place the expanded moist soil into your individual peat pots.

Once the soil pellets have fully expanded and are very moist, drop a couple of your favorite plant seeds into the soil. Cover lightly and keep in a warm location (70 - 80 degrees) for several days until the seeds germinate and sprout. Keep soil moist during this time, do not let the soil dry out. (*Germination times vary for different types of seeds, refer to the instructions on your seed packet for more information.*)

Once the seeds germinate and the plants begin to grow, you may transfer them outdoors to a planter or in-ground. Make sure outside weather temperatures are warm enough to sustain plant growth for the type of plant you are growing. If you have purchased one of our Custom Patio Pocket Planters, you may place the entire peat pot into one of the side pockets on our planters. *(No need to remove the plant from the peat pot, the roots will simply grow right out of the bottom of the pot and eventually the peat pot will break-down and dissolve into the soil.)*
